What is Umango?

Umango delivers flexibility and efficiency in scanning, naming, indexing, converting and storing of documents. Umango is easy to install, configure, and use which translates to short and painless implementation projects.

Documents can be profiled on the panel at supported MFDs, in a browser or on your tablet or mobile device. Once captured, the data and documents can be routed into a range of back office products, databases, network folders or into the cloud.

Data capture tools include zonal OCR, OMR, barcode, data lookups, key from image, and constrained list. Standard features include image enhancements, flexible document and batch separation options, full automation processing, scalability and a licensing model that has no document count limitations.
